Delivering High Availability & Network Security for Mission-Critical Network Applications, since 2000

When your business depends on web applications -- such as Outlook, e-commerce, SharePoint -- your information assets can become vulnerable to hacking, malware, malicious attacks. What can you do to ensure your network is secure? Milestone can help with a full assessment of your web application security.

There are two phases in Milestone's Web Application Security process:

- 1) Scan, identify, and validate potential vulnerabilities
 - Using advanced technology, we scan your network for a period of time to see what kind of traffic comes in and goes out.
 - Via real-time ranking, we can determine the apps with security vulnerabilities and those without proper security.
- 2) Prioritize and recommend specific steps to remediation
 - You'll get a detailed report of security problems and possibilities that could arise
 - But, unlike other companies, we don't leave you with just a list. Milestone also recommends specific steps to plugging holes, preventing intrusions, protecting certain areas, and steps to avoid possible future vulnerabilities.

Milestone also has the skills and resources to take the next step of implementing remediation and validation. We are at your service to provide best-of-breed web application firewalls and tuning, application consulting services, SSL/VPN solutions, business risk assessments and training courses to ensure your needs are met.
